Executive Summary

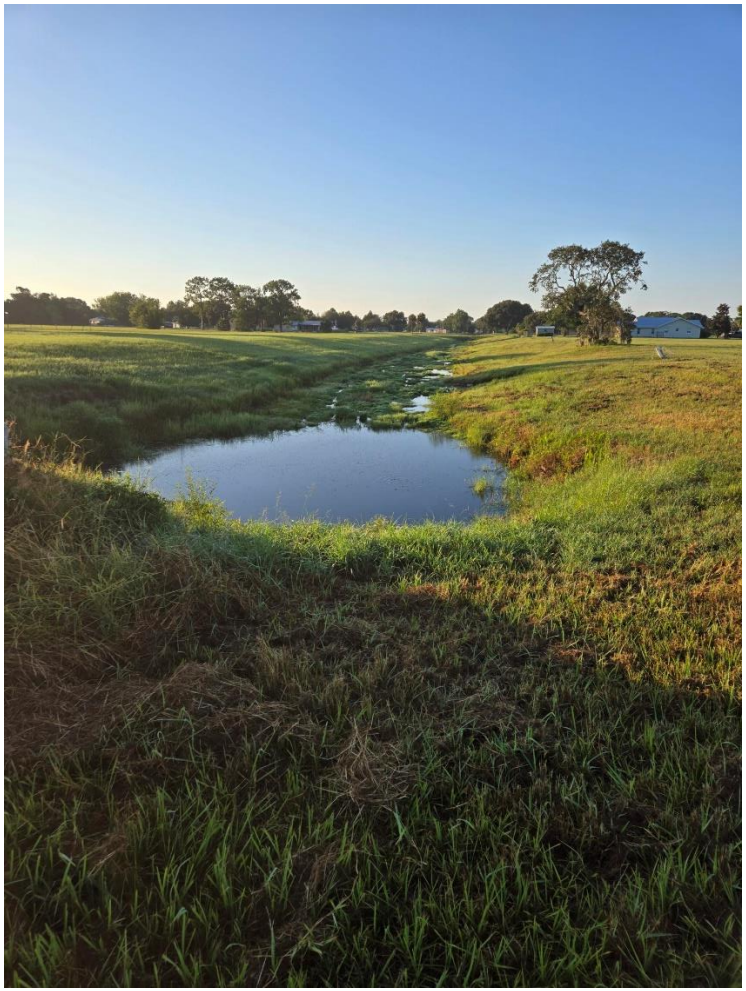
At the request of Sebring Airport Authority, AtkinsRéalis supervised the construction of a pilot surface water flow monitoring station at storm water Outfall D. Construction and equipment startup were completed at Outfall D in January 2026. Subsequent construction of surface water flow monitoring stations at Outfalls B, C, and E was completed in April 2026. Installation and startup of flow monitoring telemetry equipment was also completed in April 2026. Flow monitoring data for all four outfalls are reported commencing with completion of the May 2026 reporting period.

This is the monthly report on hourly flow monitoring results for the subject reporting period. Total recorded rainfall for this reporting period was **3.39 inches**. During this reporting period, the maximum hourly flow rate into Outfalls B, C, D, and E from airport property was **0 cubic feet per second** (cfs). Total cumulative volume of stormwater discharged into Outfalls B, C, D, and E from Sebring Regional Airport is **0 acre-feet** for this reporting period.

Visual observations recorded two to three times each week during this reporting period also indicate that the peak hourly flow of surface runoff into Outfalls B, C, D, and E is **0 cfs**. Based on those observations, the total estimated cumulative volume of stormwater discharged into Outfalls B, C, D, and E from Sebring Regional Airport is **0 acre-feet** for this reporting period.

No significant maintenance issues have been identified for this reporting period. Protective wire mesh covers have been installed over the top of the outfall flow monitoring stations at Outfalls B, C, D, and E.

Commencing with the May 2026 monthly flow monitoring report, telemetry flow information is reported for all four outfalls, Outfalls B, C, D, and E. Flow rates from those outfalls are recorded hourly and reported monthly.



Flow Monitoring Plan

In November 2025, AtkinsRéalis finalized a plan for monitoring flow rates through four storm water outfalls (Outfalls B, C. D, and E). *Storm Water Flow Monitoring Plan* (AtkinsRéalis, November 26, 2025) defines methods and procedures for measuring and reporting outfall flow rates using automated telemetry. That work plan also specifies procedures for operating and maintaining the flow monitoring equipment and the structures constructed to protect that equipment. This monthly report documents the implementation of that work plan for this reporting period.

Figure 1 is a map of surface runoff watershed areas at Sebring Regional Airport and the outfalls that discharge runoff from those areas. Figure 1 shows the locations of Outfalls B through E along the southern and eastern property boundaries of the airport.

Historically, surface runoff from Sebring Regional Airport drains from three major areas (North, West, and South Watersheds). Because the watersheds serving Outfalls B through E are all sub-watersheds of the South Watershed, these outfalls are identified on Figure 1 as outfalls South B, South C, South D, and South E. For brevity, these outfalls are discussed herein without the “South” prefix.

Outfalls B, D, and E have vertical inlet pipes, so that surface water from airport property must flow over the crest of each pipe inlet into the storm water outfall. Outfall C is a horizontal culvert pipe with an invert elevation at the outlet that is higher than that of the inlet; therefore, water does not discharge from the culvert pipe until the water surface elevation is higher than the invert elevation at the outlet of Outfall C.

Visual Observations

Since July 2024, Sebring Regional Airport personnel have inspected and photographed Outfalls B, C, D, and E once every two to three workdays each week, to document the amount of surface water runoff flowing into each outfall from airport property.

Table 1 lists observed depths of water, and estimated flow rates based on those observations, at the inlet to Outfall C and over each weir crest into Outfalls B, D, and E. Visual inspections are based on a review of photographed depths of surface water flow into Outfall C or over the inlet weirs of Outfalls B, D, and E.

The following observations are recorded for each outfall inspection and flow observation, with criteria for their applicability and conservatively high estimates of flow rates associated with each observation.

- “Flow” — Visible flow and a recordable water surface elevation based on observed staff gauge reading.
- “Low Observed Flow” — Visible evidence of recent water flow (e.g., wet surfaces, standing water, etc.) was observed and recorded, and water flow was observed (Staff Gauge Reading <0.01 foot). Estimated flow rate is 100 gpm (0.22 cfs).
- “Very low flow” — Water flow was visible at a low flow rate (Staff Gauge Reading <0.01 foot). Estimated flow rate is 1 gpm (0.002 cfs).

- “Zero Flow” No surface water flow into the storm water outfall.
- “No Observation” No photograph was taken on that date.

Visual observations, recorded two to three times each week during this reporting period, indicate that the peak hourly flow of surface runoff into Outfalls B, C, D, and E is **0 cfs**. Based on those observations, the total estimated cumulative volume of stormwater discharged into Outfalls B, C, D, and E from Sebring Regional Airport is **0 acre-feet** for this reporting period.

Flow Monitoring System

On January 23, 2026, construction of an automated storm water flow monitoring system was completed for Outfall D. The automated telemetry system records water pressure (corrected for atmospheric barometric pressure), water depth, and water temperature. Subsequently, in April 2026, additional automated storm water flow monitoring systems were constructed for Outfall B, C, and E.

To validate hourly data collected by telemetry at each flow monitoring station, even during periods of zero flow rate into the corresponding outfall, each telemetry sensor probe tip is suspended in a 5-gallon, plastic bucket, filled with water and weighted to avoid floating when the entire monitoring system’s protective structure is inundated by surface runoff. At each flow monitoring location, the top of the bucket is lower than the water surface elevation associated with the lower limit of measurable flow for the corresponding outfall.

Hourly monitoring results show that water levels in the bucket slowly drop over time due to evaporation and that water temperatures fluctuate daily due to daily warming and nightly cooling. Water in the bucket may be replenished periodically manually, or through accumulation of rainfall in the bucket, or by rising surface water that overtops into the bucket. These hourly observations provide almost real-time confirmation that each flow monitoring system is operating as expected.

Appendix A is an hourly tabulation of discharge flow rates and rainfall amounts for this reporting period, including hourly rainfall for the last 24 hours of the previous month. Rainfall data is provided herewith to generally correlate rainfall contribution to observed runoff flow rates. No surface water flow modelling was performed to route rainfall runoff for estimating expected storm water runoff flow rates.

Appendix A also provides the total cumulative volume of surface water runoff discharged into each outfall for each hour of this reporting period.

Values provided in Appendix A were determined using hourly telemetry data and associated water surface elevations provided as Appendix B, and the unique stage-discharge relationship curve for each outfall. Appendix B also provides measured water stage depth over the inlet weir crest of Outfall D and the associated flow rate, determined in accordance with procedures described in *Storm Water Flow Monitoring Plan* (AtkinsRéalis, November 26, 2025). The unique stage-discharge relationship curve, which correlates water surface elevation or water depth to flow rate, for each outfall is provided as Appendix C.

Appendix D summarizes rainfall quantities recorded by the National Weather Service (NWS) at Sebring Regional Airport for this reporting period. Appendix D shows total hourly rainfall (in inches) for the reporting period.

For this reporting period, Appendix A lists the peak hourly flow rate recorded at each outfall.

Monitoring Results

Total recorded rainfall for this reporting period is **3.39 inches**. During this reporting period, the maximum hourly flow rate into Outfalls B, C, D, and E from airport property is **0 cfs**. Total cumulative volume of stormwater discharged into Outfalls B, C, D, and E from Sebring Regional Airport is **0 acre-feet.**

Monitoring Observations

No significant maintenance issues have been identified for this reporting period. Design drawings for the outfall flow monitoring stations at Outfalls B, C, D, and E specify the installation of protective wire mesh covers to protect instrumentation from tampering, vandalism, or theft. In April 2026, protective wire mesh covers were installed over the top of the outfall flow monitoring stations at Outfalls B, C, D, and E.

Notes:

(a) Map of outfall locations is provided as Figure 1.

(b) Equipped with automated telemetry system for monitoring hourly flow rates into outfall (see Appendix A).

(c) Observations are supported by photographs.

(d) Observation criteria and flow estimates based on visual observations/photographs:

"No Observation"	denotes that no photograph was taken on that day.	
"Flow"	denotes visible flow and a recordable water surface elevation based on observed staff gauge reading.	
"Low Observed Flow"	denotes that visible evidence of recent water flow (e.g., wet surfaces, standing water, etc.) was observed and recorded, and water flow was observed (Staff Gauge Reading < 0.01 foot).	Visual estimate of flow rate: 100 gpm (0.22 cfs)
"Very Low Flow"	denotes water flow was visible at a low flow rate (Staff Gauge Reading < 0.01 foot).	Visual estimate of flow rate: 1 gpm (0.002 cfs)
"Zero Flow"	denotes no surface water flow into the storm water outfall.

Appendix A

Hourly Discharge Flow Rates
May 2026

Total Rainfall for Reporting Period[a]: **3.39 inches**
This Reporting Period[a]: 716 Hourly Measurements
Peak Hourly Rainfall Intensity (inches/hour): 0.60 inches per hour

Peak Hourly Flow Rate (cfs)			
Outfall B	Outfall C	Outfall D	Outfall E
0	0	0	0

		Measured Water Surface Elevations				Corresponding Hourly Flow Rates				Surface Runoff Volumes Discharged											
		Outfall B	Outfall C	Outfall D	Outfall E	Outfall B	Outfall C	Outfall D	Outfall E	Outfall B			Outfall C			Outfall D			Outfall E

Appendix A

Hourly Discharge Flow Rates
May 2026

Total Rainfall for Reporting Period[a]: **3.39 inches**
This Reporting Period[a]: 716 Hourly Measurements
Peak Hourly Rainfall Intensity (inches/hour): 0.60 inches per hour

Peak Hourly Flow Rate (cfs)			
Outfall B	Outfall C	Outfall D	Outfall E
0	0	0	0

		Measured Water Surface Elevations				Corresponding Hourly Flow Rates				Surface Runoff Volumes Discharged											
		Outfall B	Outfall C	Outfall D	Outfall E	Outfall B	Outfall C	Outfall D	Outfall E	Outfall B			Outfall C			Outfall D			Outfall E

Appendix A

Hourly Discharge Flow Rates
May 2026

Total Rainfall for Reporting Period[a]: **3.39 inches**
This Reporting Period[a]: 716 Hourly Measurements
Peak Hourly Rainfall Intensity (inches/hour): 0.60 inches per hour

Peak Hourly Flow Rate (cfs)			
Outfall B	Outfall C	Outfall D	Outfall E
0	0	0	0

		Measured Water Surface Elevations				Corresponding Hourly Flow Rates				Surface Runoff Volumes Discharged

Appendix A

Hourly Discharge Flow Rates
May 2026

Total Rainfall for Reporting Period[a]: **3.39 inches**
This Reporting Period[a]: 716 Hourly Measurements
Peak Hourly Rainfall Intensity (inches/hour): 0.60 inches per hour

Peak Hourly Flow Rate (cfs)			
Outfall B	Outfall C	Outfall D	Outfall E
0	0	0	0

		Measured Water Surface Elevations				Corresponding Hourly Flow Rates				Surface Runoff Volumes Discharged											
		Outfall B	Outfall C	Outfall D	Outfall E	Outfall B	Outfall C	Outfall D	Outfall E	Outfall B			Outfall C			Outfall D			Outfall E

Notes:

(a) National Weather Service, Sebring Regional Airport (see Appendix D).

(b) Based on stage-discharge relationship defined by Appendix B. Source: *Sebring Regional Airport Storm Water Flow Monitoring Plan* (AtkinsRéalis, September 2025).

(c) Based on stage-discharge relationships provided in Attachment C for Outfalls B,D, and E, with circular weir "morning glory" inlets, applicable up to $H_0 = 0.4R$. Source: *Sebring Regional Airport Storm Water Flow Monitoring Plan* (AtkinsRéalis, November 2025).

(d) Based on stage-discharge relationship provided in Attachment C for Outfall C, developed using Manning's Equation for flow in a circular pipe. Source: *Sebring Regional Airport Storm Water Flow Monitoring Plan* (AtkinsRéalis, November 2025).

(e) Water Surface Elevation = Measured Water Depth + Surveyed Elevation of Telemetry Probe Pressure Transducer

(f) Each depth probe is suspended in a water bucket to provide real-time confirmation of monitoring and telemetry system operation. The maximum water surface elevation of the bucket is below the threshold for any flow into that depth probe's associated storm water outfall.

(g) Cumulative total from beginning of reporting period to time and date of value shown. **Boldface** value at the end of each reporting period shows total cumulative discharge for this reporitng period.

(h) One acre-foot is the volume of water with a depth of 1.00 foot over one acre (i.e., 43,560 cubic feet x 7.48 gallons per cubic foot = 325,829 gallons).

Notes:

Three dashes (- - -) indicate no data was collected and/or no calculation was performed.

(a) Basis of stage-discharge relationships defined by Attachment C. Source: *Sebring Regional Airport Storm Water Flow Monitoring Plan* (AtkinsRéalis, November 2025).

(b) Measured water surface elevation at or below this elevation results in **zero flow** of surface runoff into Outfall D.
Inlet weir crest was Surveyed July 15, 2025, by Douglas W. Deans, PLS (Florida PLS 4145).

(c) As-built elevation surveys of outfall probes were completed on the following dates.
Outfall B Probe Tip: April 7, 2026, by Douglas W. Deans, PLS
Outfall C Probe Tip: April 7, 2026, by Douglas W. Deans, PLS
Outfall D Probe Tip: April 7, 2026, by Douglas W. Deans, PLS
Outfall E Probe Tip: April 7, 2026, by Douglas W. Deans, PLS

(d) Raw data collected by automated telemetry system for monitoring hourly flow rates into outfall.

(e) No data collected because *HydroVu* telemetry unit installation, startup, and operation had not been completed yet.

(f) Water Surface Elevation = Measured Water Depth + Surveyed Elevation of Telemetry Probe Pressure Transducer (Probe Tip).

(g) Basis of stage-discharge relationship provided in Attachment C, calculated for circular weir "morning glory" inlets up to $H_0 = 0.4R$. Source: *Sebring Regional Airport Storm Water Flow Monitoring Plan* (AtkinsRéalis, November 2025).

(h) Basis of stage-discharge relationship provided in Attachment C, developed using Manning's Equation for flow in a circular pipe. Source: *Sebring Regional Airport Storm Water Flow Monitoring Plan* (AtkinsRéalis, November 2025).

Appendix C. Outfall Stage-Discharge Curves

Appendix C

Outfall Stage-Discharge Curves

	Elevations (Feet NAVD88)				
	Weir Crest	Staff Gauge[a]			Depth Probe
Outfall	(Zero Depth)[a]	0.00'	MQF	Top of Gauge	Tip[c]
B	47.01	47.08	47.71	49.13	46.62
C	43.38	43.76	46.88	45.77	42.60
D	44.86	44.85	45.66	47.10	42.79
E	46.52	46.48	47.42	48.55	44.97

Note: MQF denotes Maximum Quantifiable Flow based on water depth.

49.12	4.15	>2.06	>33.2	
49.13	4.16	>2.06	>33.2	

Notes:

(a) Source: *Storm Water Flow Monitoring Plan* (AtkinsRéalis, November 26, 2026). Staff gauge and inlet weir elevations were surveyed July 15, 2025, by Douglas W. Deans, PLS (Florida PLS 4145).
(b) Water depth measured by automated telemetry system for monitoring hourly flow rates into outfall.
(c) As-built elevation survey was completed April 7, 2026, by Douglas W. Deans, PLS (Florida PLS 4145).
(d) Measured water surface elevation at or below this elevation results in negligible flow into outfall.
(e) Culvert inlet weir, inlet invert, and outlet invert elevations were surveyed July 15, 2025, by Douglas W. Deans, PLS (Florida PLS 4145).
(f) Inlet weir crest elevations of Outfall D dual inlets were surveyed July 15, 2025, by Douglas W. Deans, PLS (Florida PLS 4145). Higher of two weir crest elevations (44.85' and 44.87') was used to commence quantification of flow through both outfall culverts.
(g) No data collected because *HydroVu* telemetry unit installation, startup, and operation had not been completed yet.
